Trends

IPv6 Security for Mobile essential Security

Summary

- IPv6 becomes critical for LTE (4G) technology due to:
 - Advanced Terminals, Rich Content, User Behaviour, increased adoption of new radio technologies such as LTE
 - Over 1Billion subscribers are expected to be mobile broadband subscriber, that would use IP based smart phones for Internet applications
 - These trends push for IP address depletion in mobile for ubiquitous access of rich content from any place and any where using the same device

wheters a high-performance network infra mates a responsive and trusted environme by the deployment of services and application
